Sector: bioinformatics
biotech services > information services > database services

Profile: Malaysia Genomics Resource Centre Sdn Bhd is an ASP bioinformatics service (My Genomics Resource Centre) for the ultra-high-throughput analysis of biological data. Annual subscription packages have been designed for a range of end-users, from the individual scientist to large corporations, inclusive of 3-month free trials. MGRC will also collaborate with select industry partners on research projects of value to the life science community at large.

Services: SynaSite™ - an integrated genomics toolset ported on an ASP platform for the ultra-high-throughput analysis of biological data via Internet access.

SynaBASE™ - a novel structured network database platform which efficiently stores genetics data based on pattern constructs (subsequences) and their inter-relationships, which overcomes limitations in analysis speeds and scalability commonly associated with flat files and relational database platforms.

MGRC's set of analysis tools enables scientists to conduct a wide array of research activities ranging from high-throughput genomics searches and mining, identification of novel data hits and motifs through to more

exhaustive whole-genome comparisons and microarray chip design.

Interests: MGRC is interested to collaborate with select industry partners on research projects of value to the life science community at large. If you are interested in accessing MGRC's applications for purposes of research, which is to be made publically available please contact us at enquiries@mgrc.com.my
